

Sunflower Assets®

Standard Edition | Technical Data

Complete control of your asset management process

Sunflower Assets®, web-based asset management software gives property managers the tools to monitor, control and account for all property transactions. Sunflower Assets has two deployment options: Sunflower Assets Standard Edition and Sunflower Assets Infrastructure Edition.

Sunflower assets standard edition

The Standard Edition provides the same robust user functionality, scalability and security as the Infrastructure Edition but is deployed on a separate Oracle database and application servers. Customers have full access to the Oracle backend, allowing direct queries to the Sunflower database. The Standard Edition also allows customers to write and install custom code and interfaces, configure authentication and apply Oracle and Sunflower patches. The Standard Edition gives skilled Oracle administrators the greatest flexibility and control over the database and application servers.

Workstation specifications

Operating System(s)

- Microsoft Windows Apple Mac OS

Web Browser

(Java Web Start Required)

- Microsoft Internet Explorer
- Microsoft Edge
- Mozilla Firefox
- Google Chrome
- Apple Safari

The above specifications are for each server. CGI Federal recommends separate servers for each production, development or test environment. For more information about Sunflower asset management solutions, email us at sunflower@cgifederal.com
